Analisys

- Airfoil이 plunging(급락) 할 때 airfoil 윗면에 순간적으로 저압영역이 형성되어 뒷전방향으로의 이동을 확인함.
- Airfoil이 반대방향으로 운동할 때는 airfoil 아랫면에 저압, 윗면에 고압이 형성되지만
  그 변화범위가 plunging 할 때의 압력의 변화범위보다 작음.
- 후류의 압력 분포는 airfoil 기준으로 위, 아래가 비대칭적으로 발생됨.

Analisys

- Rotor blade upper surface 보다 lower surface 에서 보다 높은 압력 형성.
- Rotor blade surface upper surface leading edge 에서는 저압,
  Rotor blade surface lower surface leading edge 에서는 고압이 형성.
- Leading edge 와 Trailing edge 모두 국소적으로 고압이 형성.
